

# How Exterior Solar Window Film Can Get You Through the Coming Summer

U.S. Film Crew Article (Page 1 of 3)

## Summer is a great time to go out and enjoy the sun, but staying indoors during the summer isn't quite as fun.

During the mid-summer months, the temperature rises, and even though the effects of the hot summer sun are felt and prominent when we step outside, being indoors during the hot summer months can be much worse.

Unfortunately, untreated windows and glass doors don't prevent solar heat from entering your home. Harmful ultraviolet rays can still come in through glass windows and these rays can cause health problems and even damage furniture.

Here's how exterior solar window film can help homeowners get through the summer months.

### Blocks heat but retains light and the outside view

The summer months are some of the hottest months generally recorded in the calendar. While many bring out their inflatable pools and switch on the air conditioning, there are other ways to stay cool that can be much more cost-effective and less tedious.

Solar window film can reduce temperatures by up to 16 degrees Fahrenheit and make a big difference when it comes to cooling off your home. This window film blocks up to 60% solar heat and 70% visible light while still letting in some natural light.

You may think that curtains, blinds, and shades can help block some heat, and you'd be right, but they eliminate the natural light and outdoor views when they're closed. You probably would have to switch on the lights during the daytime which could end up costing you more money.

Using solar window film, you can enjoy the sun's natural light while avoiding the heat to keep your home cooler—even when it comes to the hottest days of the year.

### Protects you and your family against UV rays

UV rays can damage your skin and in some cases, even result in serious skin-related illnesses like skin cancer.

While health conditions like this are largely caused by UV rays, they also have adverse effects on certain areas of your home. UV rays can also cause artwork, flooring, furniture, and other valuable items around your home to fade over some time.

Fortunately, exterior solar window film can block up to 99% of UV rays from the sun.

## Makes you rely less on your AC

When solar window film is installed, it'll be a lot easier for you to maintain the temperature inside your home at a comfortable level. It also removes a lot of pressure from your home's air conditioning system.

According to the U.S. Bureau of Labor Statistics, consumers paid 14.3% more for electricity in 2022 than in 2021. Using your air conditioning system during the hot summer days can therefore hit you hard if you have a strict household budget.

Exterior solar window film gives your air conditioning unit a break and doesn't have to work as hard to cool your home. When your cooling unit has to work overtime to cool your home, it can also cause additional wear and tear to your air conditioning system, leaving you with more bills for extra maintenance or even repairs.

You can easily mitigate this problem with solar window film solutions, which is a one-time payment that ensures you have a comfortable temperature in your home at any time without adjusting the heating or central cooling system frequently.

## Conserves energy and saves costs

As mentioned earlier, solar window film can save energy and costs.

What's more? Sun control window film can help you reduce your electricity bills by up to 12%.

Solar window film and its ability to save costs can help you eventually pay for it.

Applying solar window film can help you save money, conserve energy, and keep your house cool during the summer—it's a great deal for homeowners!
